

# Put a Page Title Here

It has to be centered and span the whole width. Try to put it in a frame just like this with a red border and a light purple background. Make it something general about your website.

Betty Crocker® Sweet Inspirations  
Warm Caramel Apple Cake

Your name:	
Your phone number:	
Shipping address:	

[illegible]

~~You must use a "hidden" input with attributes 'name=lastname' and 'value=your actual name'~~

Try to recreate the above layout as closely as you can. The form should submit to the handler:  
action = "http://ck.csit.selu.edu/~ck/cgi-bin/formhandler.pl"  
This handler will simply tell you what you have submitted to the server. try it to make sure it works

There are three items and each is within a box and has options (you need at least two options for each). The first implements options with Radio buttons, the second with a drop-down list and the third with checkboxes.

Text and textboxes should maintain their relative positions when the user changes the default font of the browser. If you do not use tables or CSS for positioning, and the default font size becomes large, the textboxes will wrap to the next line; so make sure to prevent that.

The shipping information section is centered but the message section is left justified.

Fonts and colors of fonts (not backgrounds) do not need to be any particular ones; you can pick your own, however, what is bold or italics must be recreated as bold and italics, and any colors different than standard black must also be some colors of your choice (but not necessarily the same as above). Background colors for the various areas must be close to what is shown here.

You may use your own images or you may use the same ones used in the above layout. The images are links to the web pages where I got them from. If you use your own then make sure that you place them on the class server and use absolute URLs so that they are still visible even if your html file is moved.

If you would like to add anything of your own for artistic style feel free to do so. You may use straight HTML or you may use CSS as you like, this is up to you. But I need you to achieve the layout/geometry shown above and include the info shown.
